6.8.1 Detailed Description

```
template<typename T>
class r_type::net::AServer< T >
```

[AServer](#) class template for managing server operations.

This class template provides a framework for creating and managing a server that handles client connections, messages, and entity updates. It uses the ASIO library for asynchronous network communication and provides various functions for server operations such as starting, stopping, and updating the server, as well as handling client messages and connections.

Template Parameters

<i>T</i>	The type of data that the server handles.
----------	---

6.8.2 Constructor & Destructor Documentation

6.8.2.1 AServer()

```
template<typename T >
r_type::net::AServer< T >::AServer (
    uint16_t port ) [inline]
```

Constructs an [AServer](#) object with the specified port.

This constructor initializes the server with the given port number and sets up the necessary components for the server to function. It initializes the ASIO socket with the provided port and creates instances of [EntityManager](#), [EntityFactory](#), and [ComponentManager](#). Additionally, it initiates the background process and creates three basic monster entities using the entity factory.

Parameters

<i>port</i>	The port number on which the server will listen for incoming connections.
-------------	---

6.8.2.2 ~AServer()

```
template<typename T >
r_type::net::AServer< T >::~~AServer ( ) [inline]
```

Destructor for the [AServer](#) class.

This destructor ensures that the server is properly stopped by calling the [Stop\(\)](#) method when an instance of [AServer](#) is destroyed.

6.8.3 Member Function Documentation

```
template<typename T >
void r_type::net::AServer< T >::WaitForClientMessage ( ) [inline]
```

Waits for a client message asynchronously.

This function waits for a client message by asynchronously receiving data from the socket. When a message is received, it checks if the client endpoint protocol is UDPv4. If the protocol is not UDPv4, it recursively calls itself to wait for another client message. If the protocol is UDPv4 and there are no errors, it prints the client endpoint and checks if a connection already exists. If a connection already exists, it returns without further processing. If a connection does not exist, it creates a new client socket, binds it to a local endpoint, and creates a new connection object. It then calls the OnClientConnect function to check if the client connection is approved. If the connection is approved, it adds the new connection to the list of connections, connects it to the client, and prints the connection ID. If the connection is denied, it prints a message indicating the connection was denied. If there is an error during the receive operation, it prints the error message..

A component manager that stores components in an unordered map.

6.18.1 Detailed Description

Manages the components of entities in an ECS system.

The [ComponentManager](#) class provides functionality to add and retrieve components for entities in an ECS system. It uses an unordered map to store the components, where the key is the type of the component and the value is another unordered map that maps entity IDs to their corresponding component values.

6.18.2 Member Function Documentation

6.18.2.1 [addComponent\(\)](#)

```
template<typename ComponentType , typename... Args>
void ComponentManager::addComponent (

Adds a component to an entity.

Template Parameters

<i>ComponentType</i>	The type of the component to add.
<i>Args</i>	The types of the arguments to forward to the component's constructor.

Parameters

<i>entity↵ Id</i>	The ID of the entity to add the component to.
<i>args</i>	The arguments to forward to the component's constructor.

6.18.2.2 GetComponent()

```

6.18.3 Member Data Documentation**6.18.3.1 components**

```
std::unordered_map<std::type_index, std::unordered_map<int, std::any> > ComponentManager←
::components [private]
```

A component manager that stores components in an unordered map.

This component manager uses an unordered map to store components. The keys of the outer map are of type `std::type_index`, which represents the type of the component. The values of the outer map are inner unordered maps, where the keys are of type `int` and represent the entity ID, and the values are of type `std::any`, which allows storing components of any type.

    ComponentManager & componentManager,
    EntityManager & entityManager,
    std::chrono::system_clock::time_point newClock ) [inline], [override]
```

Updates the collision status of entities in the game.

This function checks for collisions between entities and handles the consequences of those collisions, such as updating health, removing entities, and adding new entities. It also handles entities that go off-screen.

Parameters

<i>server</i>	Pointer to the server instance.
<i>componentManager</i>	Reference to the component manager.
<i>entityManager</i>	Reference to the entity manager.
<i>newClock</i>	The current time point for the update.

6.40.2.3 `FireUpdate()`

```
template<typename T >
void r_type::Level< T >::FireUpdate (
    r_type::net::AServer< T > * server,
    ComponentManager & componentManager,
    EntityManager & entityManager,
    std::chrono::system_clock::time_point newClock ) [inline], [override]
```

Updates the firing mechanism of entities in the game.

This function handles the automatic firing system and processes the firing logic for entities. It retrieves all entities and checks if they can shoot. If an entity can shoot, it sends a message to all clients to create an enemy missile and sets the entity's canShoot flag to false.

Parameters

<i>server</i>	Pointer to the server instance.
<i>componentManager</i>	Reference to the ComponentManager handling components.
<i>entityManager</i>	Reference to the EntityManager handling entities.
<i>newClock</i>	The current time point used for timing events.

6.40.2.4 `LevelOne()`

```
template<typename T >
void r_type::Level< T >::LevelOne (
    r_type::net::AServer< T > * server,
    ComponentManager & componentManager,
    EntityManager & entityManager,
    std::chrono::system_clock::time_point newClock ) [inline], [override]
```

Handles the spawning of entities for [Level One](#).

This function is responsible for spawning basic monsters and shooter enemies at specific intervals defined by the game parameters. It checks the elapsed time since the last spawn of each entity type and spawns new entities if the required time has passed.

Parameters

<i>server</i>	Pointer to the server instance.
<i>componentManager</i>	Reference to the ComponentManager instance.
<i>entityManager</i>	Reference to the EntityManager instance.
<i>newClock</i>	The current time point used for timing calculations.

6.40.2.5 MoveUpdate()

```
template<typename T >
void r_type::Level< T >::MoveUpdate (
    r_type::net::AServer< T > * server,
    ComponentManager & componentManager,
    EntityManager & entityManager,
    std::chrono::system_clock::time_point newClock ) [inline], [override]
```

Updates the positions of entities and notifies clients of any changes.

This function performs the following steps:

1. Retrieves the current positions of entities and stores them.
2. Moves the entities using the move system.
3. Compares the new positions with the previous positions.
4. If an entity's position has changed, sends an update message to all clients.

Parameters

<i>server</i>	Pointer to the server instance.
<i>componentManager</i>	Reference to the ComponentManager .
<i>entityManager</i>	Reference to the EntityManager .
<i>newClock</i>	The current time point.

6.40.2.6 SetGameParameters()

```
template<typename T >
void r_type::Level< T >::SetGameParameters (
    GameParameters gameParameters ) [inline]
```

Sets the game difficulty based on the provided game parameters.

This function sets the game difficulty based on the provided game parameters.

Parameters

<i>gameParameters</i>	The game parameters to set the difficulty.
-----------------------	--

6.40.2.7 SetSystem()

```
template<typename T >
void r_type::Level< T >::SetSystem (
    ComponentManager & componentManager,
    EntityManager & entityManager ) [inline], [override]
```

Initializes and sets up various systems for the level.

This function overrides a base class method to initialize and set up the [MoveSystem](#), [CollisionSystem](#), [AnimationSystem](#), and [AutoFireSystem](#) using the provided [ComponentManager](#) and [EntityManager](#).

Parameters

<i>componentManager</i>	Reference to the ComponentManager used to manage components.
<i>entityManager</i>	Reference to the EntityManager used to manage entities.

6.40.2.8 SpawnEntity()

```
template<typename T >
void r_type::Level< T >::SpawnEntity (
    r_type::net::AServer< T > * server,
    EntityManager & entityManager,
    ComponentManager & componentManager,
    int nbrOfEnemy,
    EntityFactory::EnemyType enemyType ) [inline]
```

Spawns a specified number of enemy entities in the game.

This function creates and spawns a specified number of enemy entities of a given type at random positions within the game world. The enemy entities are then broadcasted to all connected clients.

Template Parameters

<i>T</i>	The type of the server.
----------	-------------------------

Parameters

<i>server</i>	A pointer to the server instance.
<i>entityManager</i>	Reference to the EntityManager responsible for managing entities.
<i>componentManager</i>	Reference to the ComponentManager responsible for managing components.
<i>nbrOfEnemy</i>	The number of enemy entities to spawn.

Parameters

<i>enemyType</i>	The type of enemy to spawn (e.g., BasicMonster, ShooterEnemy).
------------------	--

6.40.2.9 Update()

```
template<typename T >
void r_type::Level< T >::Update (
    r_type::net::AServer< T > * server,
    ComponentManager & componentManager,
    EntityManager & entityManager,
    std::chrono::system_clock::time_point newClock,
    bool * bUpdateEntities ) [inline], [override]
```

Updates the game state by processing entity movements, handling collisions, and sending messages to clients.

This function performs several tasks to update the game state:

- Moves entities based on the elapsed time.
- Handles collisions between entities.
- Sends messages to clients about destroyed entities.
- Updates animations and firing mechanisms.

Parameters

<i>server</i>	Pointer to the server instance.
<i>componentManager</i>	Reference to the ComponentManager handling game components.
<i>entityManager</i>	Reference to the EntityManager handling game entities.
<i>newClock</i>	The current time point used to calculate elapsed time.
<i>bUpdateEntities</i>	Pointer to a boolean flag indicating whether entities should be updated.

6.52.1 Detailed Description

Represents a class that manages different scenes in a game.

The [Scenes](#) class provides functionality to display and manage various scenes in a game, such as the main menu, game loop, settings menu, and in-game menu. It also allows setting the game mode and daltonism mode.

6.52.2 Constructor & Destructor Documentation

6.52.2.1 Scenes()

```
Scenes::Scenes (
    std::string ip,
    int port )
```

Construct a new [Scenes](#) object.

Parameters

<i>window</i>	
---------------	--

6.52.2.2 ~Scenes()

```
Scenes::~~Scenes ( ) [default]
```

Destroy the [Scenes](#) object.

6.52.3 Member Function Documentation

6.52.3.1 difficultyChoices()

```
void Scenes::difficultyChoices ( ) [virtual]
```

displays the difficulty choices, creates all the necessary entities

Implements [IScenes](#).

6.52.3.2 gameLoop()

```
void Scenes::gameLoop ( ) [virtual]
```

displays the main game loop, creates all the necessary entities

Implements [IScenes](#).

6.52.3.3 getRenderWindow()

```
sf::RenderWindow* Scenes::getRenderWindow ( ) [inline], [virtual]
```

Get the RenderWindow object.

Returns

sf::RenderWindow*

Implements [IScenes](#).

6.52.3.4 HandleMessage()

```
void Scenes::HandleMessage (
    r_type::net::Message< TypeMessage > & msg,
    ComponentManager & componentManager,
    TextureManager & textureManager,
    FontManager & fontManager,
    std::shared_ptr< AudioSystem > & audioSystem )
```

6.52.3.5 inGameMenu()

```
void Scenes::inGameMenu ( ) [virtual]
```

displays the in game menu, creates all the necessary entities

This function handles the main game loop for the [Scenes](#) class.

It contains the logic for connecting to a server, updating entities, handling user input, and rendering the game.

The game loop performs the following steps:

1. Connects to a server using the [r_type::net::Client](#) class.
2. Initializes the [ComponentManager](#), [TextureManager](#), and [EntityManager](#).
3. Creates a background entity and sets its sprite component.
4. Defines lambda functions for updating player position and firing missiles.
5. Enters the main loop, which continues until the window is closed.
6. Within the loop, it checks for user input events and handles them accordingly.
7. If the server is connected, it processes incoming messages and updates entities accordingly.
8. It then updates the entities using the [UpdateSystem](#) and renders them using the [RenderSystem](#).

Note

This code assumes the presence of the [r_type::net::Client](#), [ComponentManager](#), [TextureManager](#), [EntityManager](#), [UpdateSystem](#), and [RenderSystem](#) classes.

Displays the in-game menu.

Implements [IScenes](#).

6.52.3.6 mainMenu()

```
void Scenes::mainMenu ( ) [virtual]
```

displays the main menu, creates all the necessary entities

Displays the main menu scene.

This function creates the main menu scene, including the background, buttons, and event handling. The main menu scene allows the user to navigate to different scenes by clicking on the buttons. The buttons include "Play", "↩ Settings", and "Quit". The function continuously updates and renders the scene until the user closes the window or navigates to a different scene.

Returns

void

Implements [IScenes](#).

6.52.3.7 render()

```
void Scenes::render ( ) [virtual]
```

display what must be displayed (main menu, game loop, settings menu, in game menu), creates all the components needed and manages them

Renders the current scene based on the value of currentScene.

The render function uses a switch statement to determine which scene to render. It calls the corresponding member function based on the value of currentScene.

Note

The currentScene variable must be set before calling this function.

Implements [IScenes](#).

6.52.3.8 run()

```
void Scenes::run ( )
```

6.52.3.9 settingsMenu()

```
void Scenes::settingsMenu ( ) [virtual]
```

displays the settings menu, creates all the necessary entities

Displays the settings menu.

This function is responsible for displaying the settings menu in the game. It does not return any value.

Implements [IScenes](#).

6.52.3.10 shouldQuit()

```
bool Scenes::shouldQuit ( ) [inline], [virtual]
```

check if game should stop running

Returns

true

false

Implements [IScenes](#).

6.52.3.11 StopGameLoop()

Public Member Functions

- `sf::Texture & getTexture (const std::string &filePath)`
Retrieves a texture from the texture manager.
- `void releaseTexture (const std::string &filePath)`

Private Attributes

- `std::unordered_map< std::string, sf::Texture > textures`
A container for storing textures with string keys.

6.61.1 Member Function Documentation

6.61.1.1 `getTexture()`

```
sf::Texture& TextureManager::getTexture (
    const std::string & filePath ) [inline]
```

Retrieves a texture from the texture manager.

This function attempts to find the texture associated with the given file path in the texture manager. If the texture is found, it is returned. Otherwise, a new texture is loaded from the file path and added to the texture manager before being returned.

Exceptions

failedToLoadTexture	If the texture fails to load from the file path.
-------------------------------------	--

Parameters

<i>filePath</i>	The file path of the texture to retrieve.
-----------------	---

Returns

`sf::Texture&` A reference to the retrieved texture.

6.61.1.2 `releaseTexture()`

```
void TextureManager::releaseTexture (

6.61.2 Member Data Documentation

6.61.2.1 textures

```
std::unordered_map<std::string, sf::Texture> TextureManager::textures [private]

    sf::Event event,
    ComponentManager & componentManager,
    sf::RenderWindow * _window,

    Scenes * scenes )
```

Handles events for the scene, including window close and mouse button press events.

This function processes events from the given `RenderWindow` and performs actions based on the type of event. It handles window close events and mouse button press events. For mouse button press events, it checks if the left mouse button was pressed and if the click occurred within the bounds of any button entities. If a button is clicked, it triggers the associated `OnClickComponent` or `BindComponent` actions.

Parameters

<i>event</i>	The event to handle.
<i>componentManager</i>	Reference to the <code>ComponentManager</code> to access components of entities.
<i>_window</i>	Pointer to the <code>RenderWindow</code> where events are polled from.
<i>buttons</i>	Vector of shared pointers to <code>Entity</code> objects representing buttons.

7.59.2 Function Documentation

7.59.2.1 animationShipFactory()

```
vf2d animationShipFactory (
    AnimationShip animation )
```

Factory function to create a ship animation.

This function takes an AnimationShip object and generates a corresponding [vf2d](#) object that represents the animation of the ship.

Parameters

<i>animation</i>	The AnimationShip object containing the animation details.
------------------	--

Returns

[vf2d](#) The generated animation for the ship.

Factory function to create a ship animation.

This function takes an AnimationShip enumeration value and returns a [vf2d](#) vector that corresponds to the animation state of the ship.

Parameters

<i>animation</i>	The animation state of the ship, represented by the AnimationShip enumeration.
------------------	--

Returns

[vf2d](#) A vector representing the animation state of the ship. The x-coordinate of the vector corresponds to the frame position, and the y-coordinate is always -1 for valid states. If the animation state is not recognized, the function returns {0, 0}.

7.59.2.2 operator"!=()

```
bool operator!= (
    AnimationComponent animation,
    AnimationComponent other )
```

get if two animations are different.

Parameters

<i>animation</i>	The first animation.
<i>other</i>	The second animation.

Returns

bool true if the animations are different, false otherwise.

get if two animations are different.

This operator compares two [AnimationComponent](#) objects to determine if they are not equal. Two [AnimationComponent](#) objects are considered not equal if any of their respective offset or dimension coordinates differ.

Parameters

<i>animation</i>	The first AnimationComponent to compare.
<i>other</i>	The second AnimationComponent to compare.

Returns

true if the [AnimationComponent](#) objects are not equal, false otherwise.
